This is perfect for student art projects. Our friends at 3Danimators provided another free, great resource for animators on their site. Learn how to make a sweet drawing animation with Blender and the GIMP. A great starter tutorial. Finally, if you haven't already checked out the NSFW video, below, you should. Cognitive control and time estimation: a neuroscientific review. This paper reviews and synthesizes the neuroscientific literature on the link between time and cognitive control. We propose a set of underlying processes, including the ones related to time estimation and processing, which have been shown to interact with cognitive control and with one another. We present a model of the mechanisms underlying the interplay between cognitive control and time processing, in which the possible effects of cognitive control on time estimation and on temporal representations of time itself are discussed. Empirical data obtained from time estimation and time production experiments are put in light of the described model and several hypotheses are proposed to account for the lack of consensus in the literature. Abacavir affects influenza A and B virus replication. Protease inhibitors have been shown to inhibit influenza virus replication in cultured cells. The influence of abacavir, an antiretroviral drug that also inhibits the influenza virus protease, on influenza virus replication was evaluated in cultured human cells. Abacavir was shown to inhibit influenza A (H3N2) and B (WSN) virus replication at clinically relevant drug concentrations in the range of 1-10 microg/ml. Inhibition was dose-dependent with IC(50)s of 3.7+/-0.9 microg/ml (n=4) for H3N2, and 7.7+/-1.5 microg/ml (n=5) for WSN. Further, the inhibitory effect of abacavir on WSN virus replication was shown to be selective as replication of a number of other viruses was not affected. We conclude that abacavir inhibits influenza virus replication in cultured human cells at concentrations which may be reached during treatment of patients with the drug. North Korea has launched another missile into the Sea of Japan, just weeks after successfully testing a submarine-launched ballistic missile (SLBM). An unidentified missile was launched on Thursday morning (local time) from the sea on the north side of the Korean peninsula, the Ministry of Defense said. The missile flew only a few minutes, 82157476af
